Assignment 0124 Feedback

Because this assignment serves as a building block to the effective use of a command-based system shell, outcome *1a* tops out at **|**. Later, more advanced assignments will allow this outcome to expand to the maximum **+**.

Lisa Rosenbaum

1a — You did perfectly fine with your DIY *git* repository, showing that you can execute simple prewritten sequences of commands correctly (and you had some fun with it, judging by the files that were there **:)**). However, it seems that there was a misunderstanding with the symbol and command definitions: the instructions were to create one file for each (names and symbols; commands). Instead, you had just one file with 9 commands and 1 symbol (PATH). So this part is missing content; see the examples from the assignment sheet for more possibilities. Commands differ from names and symbols in this way: when you type in a command, something happens. Names and symbols by themselves don't do anything, but instead are used in various commands to get those commands to behave in some particular way. (**/**)

4d — You found some good information sources and used them well, but need to pull more out of these sources to complete the requested work. (**|**)

4e — You used one commit for the file, which is appropriate for this scale of assignment. Your commit message is sufficiently descriptive. (**+**)

4f — Submitted on time, but incomplete. (**|**)
